Maropost UAT - Quick How-To

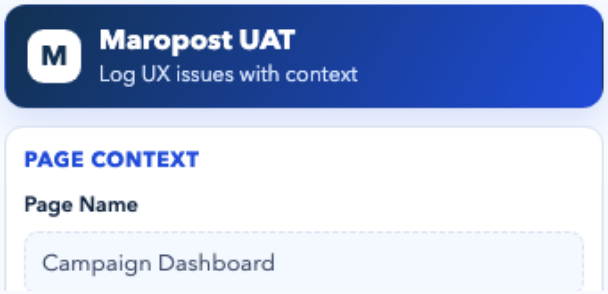
Capture UX feedback and export issue logs in CSV

WORKFLOW

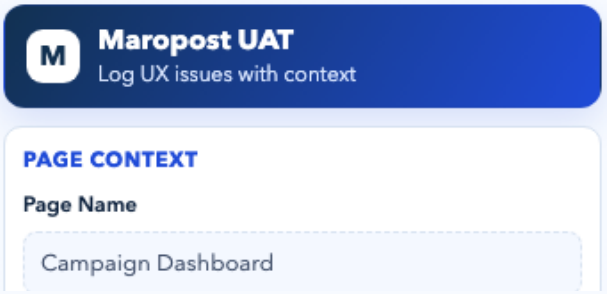
1. Open your Maropost app screen and click the **Maropost UAT** extension icon.
2. Confirm auto-filled context: **Page Name**, **URL**, and **Timestamp**.
3. Select **Severity** and **Feedback Type**.
4. Enter a clear issue description in **Feedback**.
5. Optional: click **Pick Area** and select the on-page container where the issue appears.
6. Optional: add a **Suggested Reference Link** (plain domains are accepted).
7. Click **Save** for each issue.
8. Use **View Logs** for filter/search/delete and **Download CSV** at end of QA.

TIPS

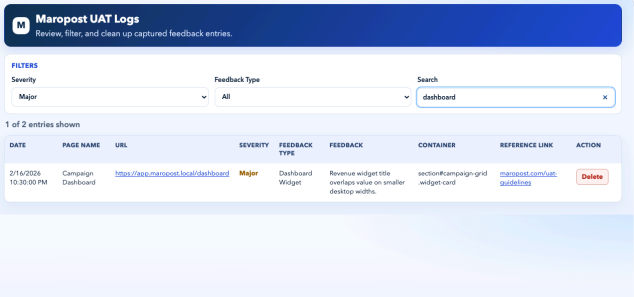
Use concise, reproducible feedback and keep one issue per log entry. Mark only release-blocking issues as **Blocker**. The exported CSV includes date, page details, type, severity, feedback, selected container name, and reference link.



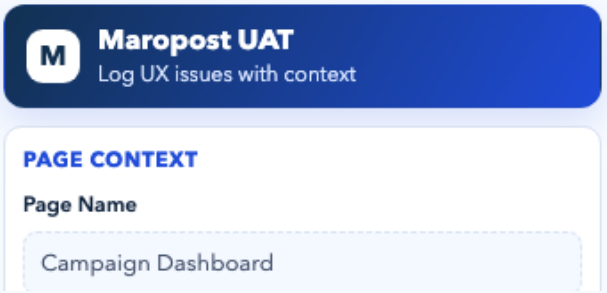
1) Filled popup ready to save



2) Container pinpoint captured



3) Logs view with filters and table



4) CSV export status confirmation
